Course Description

Survival strategies, gene regulation and metabolism of waterborne pathogens. Methods for microbe detection and control.

Course Learning Objectives

The central objective of this course is to foster the student's ability to solve problems related to microbiological quality and safety of drinking and recreational waters. The development of problem-solving skills will require an in-depth understanding of microbial ecology concepts and methodologies for identifying and characterizing pathogens and their behaviors outside of their human hosts.

By the end of the course, the student will be able to:

- Identify common environmentally transmitted pathogens.
- Recommend appropriate detection methods for human waterborne pathogens.
- Evaluate factors contributing to the spread of environmentally transmitted pathogens.
- Recommend methods to reduce human exposure to waterborne pathogens.
- Create science communication documents to convey course concepts to a general audience.

Course Overview and Purpose

This course examines common waterborne pathogens from an ecological perspective, including how pathogens survive and are dispersed through the environment outside of human hosts. The course will also cover a variety of methods used to detect pathogens, the evolution of virulence and antimicrobial resistance, drinking water and wastewater treatment, and microbial risk assessment.

Course Prerequisites

MCB 3020 (Basic Biology of Microorganisms) or MCB 3023 (Principals of Microbiology) or MCB 4203 (Bacterial Pathogens), or equivalent.

Textbooks, Learning Materials, and Supply Fees
